ABSTRACT

A polyamide resin composition comprising a polyamide resin (A), an inorganic filler (B), and a white pigment (C) and can provide a molded product which is excellent in mechanical strength and heat resistance. The composition can also comprise a specific ultraviolet absorber (D), or both an ultraviolet absorber (D) and a hindered amine compound (E). The polyamide resin composition can impart excellent mechanical strength, heat resistance and adhesive properties to a sealing resin such as an epoxy resin of a molded product, particularly precision insert molded products, and the resin composition can provide a reflector plate that realizes a reduced drop of light reflectance.
